

CONTENTS

Foreword	(iii)
Preface	(v)
Chapter 1 : INTRODUCTION	
1.1 Background	1
Chapter 2 : PRIMARY FACTORS FOR CONSIDERATION IN SEISMIC DESIGN	
2.1 Regional Geologic Setting	2
2.2 Local Geologic Setting	3
Chapter 3 : SELECTION OF EARTHQUAKE	
3.1 General	4
3.1.1 Terminology/Procedures	4
3.1.2 General Considerations	4
Chapter 4 : DETERMINISTIC/PROBABILISTIC APPROACH	
4.1 Maximum-Design Earthquake (MDE)	5
4.2 Operating-Basis Earthquake (OBE)	6
4.3 Procedure for Selecting Earthquake	6
4.3.1 Deterministic Approach	6
4.3.2 Probabilistic Approach	6
Chapter 5 : FACTORS INFLUENCING SEISMIC EVALUATION	
5.1 General	7
5.2 Seismic Hazard Rating	7
5.3 Risk Potential Rating	9
5.4 Influence of Type of Dams	11
5.4.1 Concrete Dams	11
5.4.2 Embankment Dams	11

Chapter 6 : SELECTION/ DETERMINATION OF SEISMIC EVALUATION PARAMETERS

6.1	General	13
6.2	Deterministic Approach	13
6.2.1	Peak Ground Motion Parameters	13
6.2.2	Duration	14
6.2.3	Response Spectra	14
6.2.4	Acceleration Time Histories	15
6.2.4.1	Superposition Methods	15
6.2.4.2	Stochastic Processes	16
6.2.4.3	Fault-Rupture Models	16
6.3	Probabilistic Approach	16

Chapter 7 : GLOSSARY

REFERENCES

ANNEXURES

Annexure 1	: List of Primary Factors to Consider in Seismic Design	21
Annexure 2	: Steps for Earthquake Analysis and Design including Selection/Evaluation of Seismic Design Parameters	23
Annexure 2 (A):	Flow Chart of Seismic Risk Study and Aseismic Design	25
Annexure 3	: Some of the Widely used Attenuation Relations for Peak Ground Acceleration	26
Annexure 3 (A):	Symbols and Definitions	31
Annexure 4	: Duration versus Epicentral Distance and Magnitude for the Soil Site	33
Annexure 4 (A):	Duration Versus Epicentral Distance and Magnitude for the Rock Site	34
Annexure 4 (B):	Maximum Ground Acceleration and Durations of Strong Phase of Shaking	35
